Signed, Sealed, Delivered: Digital Receipts in the Ugandan Dairy Chain (Job Market Paper)

with David J. Henning

Using a randomized experiment with dairy cooperatives in western Uganda, we provide causal evidence that SMS-based digital receipts for daily milk deliveries improve accountability, product quality, and delivery frequency. In a context of weak monitoring and imperfect transaction information, these messages allow smallholder farmers to better observe the behavior of intermediaries in the supply chain. The intervention effects vary with the intensity of information frictions. Among farmers facing high information frictions (i.e., those relying on intermediaries to transport milk), the intervention increased the detection of discrepancies and encouraged switching away from dishonest intermediaries. Farmers in low-friction settings (those who deliver milk themselves) delivered more frequently; the likely mechanism is a behavioral nudge created by receiving messages both on days with deliveries and days without deliveries. We also find that the intervention increased milk quality for both self-deliverers and farmers using transporters. Overall, our results show that simple digital tools can reduce information asymmetries and strengthen accountability in smallholder supply chains.

Banking Amidst Conflict: How Violence Shapes Financial Inclusion in Mexico

with Xiaofei Wang

We study how exposure to violence shapes the use of formal financial services in Mexico. Using administrative records on violent incidents, we train a long short-term memory (LSTM) neural network to generate out-of-sample, municipality-level forecasts of violence and define violence shocks as unexpected deviations of realized violence from these predictions. We combine these shocks with nationwide administrative transaction data from the National Banking and Securities Commission (CNBV) covering ATM and correspondent banking activity across all municipalities from 2014 to 2019. We find that unexpected spikes in violence reduce ATM transactions per capita by approximately 1.6 percent in the month of the shock and 1.3 percent the following month, with effects dissipating within two months. In contrast, we find no statistically significant response in correspondent banking activity at

any horizon, with point estimates close to zero. This divergence indicates that violence primarily disrupts access to traditional ATM infrastructure rather than inducing broad financial disengagement, and suggests that correspondent banking can serve as a partial buffer against violence-induced disruptions.
